

# How much does your parcel weigh?

## Cubing guide

You'll need to know your parcel's actual weight and its cubic weight, as the delivery rate is calculated on whichever is the greater.

The cubic conversion rate is 250kg per cubic metre, so cubic weight =  $H \times W \times L \times 250$ .

1. Convert measurements to metres.

### Example: if a parcel is...

<b>Height</b>	80cm >	0.8m
<b>Width</b>	50cm >	0.5m
<b>Length</b>	15cm >	0.15m

2. Multiply the height x width x length x cubic conversion (250) to get cubic weight.

**Example: (H) 0.8m x (W) 0.5m x (L) 0.15m x 250 = 15kg**

3. So, if the actual weight of this parcel was 5kg and the cubic weight was 15kg, **the greater weight** of 15kg is used to calculate the price.
